

e& Business Network Operations Guide

Customer Service and Support Procedures

1. Introduction

The Business Network Operations (BNO) department at e& provides technical support and service management for business customers. This document outlines procedures for handling customer service requests, troubleshooting customer-reported issues, and maintaining service level agreements (SLAs). All BNO support personnel must follow these procedures to ensure consistent, high-quality customer service.

2. Service Level Agreements

BNO maintains SLAs with business customers that define service availability, response times, and resolution targets. Standard SLAs include:

- **Platinum Tier:** 99.99% uptime, 15-minute response time, 1-hour resolution target
- **Gold Tier:** 99.95% uptime, 30-minute response time, 4-hour resolution target
- **Silver Tier:** 99.9% uptime, 1-hour response time, 8-hour resolution target
- **Bronze Tier:** 99.5% uptime, 4-hour response time, 24-hour resolution target

SLA compliance is monitored continuously and reported monthly to customers. Service credits are provided when SLAs are not met according to contract terms.

2.1 Service Request Classification

All customer service requests are classified based on priority and impact:

Priority	Description	Response Time	Resolution Target
P1 - Critical	Complete service outage affecting business operations	15 minutes	1 hour

P2 - High	Significant service degradation or partial outage	30 minutes	4 hours
P3 - Medium	Minor service issues or non-critical problems	2 hours	8 hours
P4 - Low	Service requests, information inquiries	4 hours	24 hours

2.2 Customer Communication

Customers are notified of service issues according to their SLA tier. Critical issues trigger immediate phone calls to designated contacts. Status updates are provided every 30 minutes for P1 issues, every 2 hours for P2 issues, and daily for P3/P4 issues. All communications are logged in the ticketing system.

3. Service Request Handling

All customer service requests are logged in the ticketing system with unique ticket numbers. Tickets are assigned to appropriate technical teams based on issue type and customer tier. Ticket status is updated in real-time and customers can track progress through the customer portal.

3.1 Initial Response Procedures

Upon receiving a service request, the following steps are taken:

1. Create ticket in ticketing system with all relevant details
2. Classify priority based on impact and customer SLA
3. Assign to appropriate technical team
4. Send acknowledgment to customer within response time SLA
5. Begin initial troubleshooting and information gathering

6. Escalate if issue exceeds team capabilities

3.2 Troubleshooting Workflow

Standard troubleshooting workflow for customer issues:

1. **Information Gathering:** Collect details about the issue including symptoms, affected services, time of occurrence, and any recent changes
2. **Initial Diagnosis:** Review network monitoring data, check device status, and analyze recent logs
3. **Remote Diagnostics:** Perform connectivity tests, check routing, and verify service configuration
4. **On-Site Visit:** If remote resolution is not possible, schedule on-site visit (for applicable service tiers)
5. **Resolution:** Implement fix and verify service restoration
6. **Documentation:** Document root cause, resolution steps, and preventive measures
7. **Follow-up:** Confirm with customer that issue is resolved and service is restored

4. Common Customer Issues and Resolutions

4.1 Connectivity Issues

Connectivity problems are the most common customer-reported issues. Resolution steps include:

- Verify physical connections at customer premises
- Check customer router/CPE status and configuration
- Test connectivity from customer network to e& edge
- Review routing tables and verify customer routes are present
- Check for network outages or maintenance activities
- Verify customer IP addressing and VLAN assignments
- Test bandwidth and verify SLA compliance

4.2 Performance Issues

Performance degradation complaints require analysis of:

- Bandwidth utilization trends
- Latency measurements to various destinations
- Packet loss statistics
- Network device CPU and memory utilization
- Traffic patterns and top talkers
- Application performance metrics

Resolution may involve bandwidth upgrades, traffic shaping adjustments, or routing optimizations.

4.3 Service Configuration Requests

Customers may request changes to their service configuration including:

- IP address changes or additions
- VLAN modifications
- Firewall rule updates
- Quality of Service (QoS) adjustments
- Routing changes
- Service upgrades or downgrades

All configuration changes follow the change management process and require customer approval before implementation.

5. Customer Onboarding

New business customers undergo an onboarding process to ensure proper service delivery:

5.1 Pre-Installation

Before service installation:

- Site survey is conducted to assess infrastructure requirements
- Service design is created based on customer requirements
- Equipment is ordered and prepared
- Installation date is scheduled with customer
- Customer is provided with pre-installation checklist

5.2 Installation

During service installation:

- Equipment is installed and configured according to design
- Connectivity is tested end-to-end
- Customer equipment is configured if required
- Service is verified and performance tests are conducted
- Customer training is provided on service features
- Documentation is provided to customer

5.3 Post-Installation

After installation:

- Service is monitored for 48 hours to ensure stability
- Customer is contacted for feedback and confirmation
- Any issues are resolved promptly
- Service documentation is finalized
- Customer account is activated for ongoing support

6. Customer Account Management

Customer accounts are managed through the customer relationship management (CRM) system.

Account information includes:

- Customer contact details and escalation contacts
- Service inventory and configurations
- SLA tier and contract terms
- Service history and past incidents
- Billing information
- Technical documentation

Account information is updated regularly and reviewed during quarterly business reviews with customers.

6.1 Account Reviews

Quarterly business reviews are conducted with key customers to:

- Review service performance and SLA compliance
- Discuss service improvements and optimizations
- Address customer concerns and feedback
- Plan for future service requirements
- Review contract terms and renewals

7. Escalation Procedures

When customer issues cannot be resolved within SLA targets, escalation procedures are followed:

7.1 Technical Escalation

Technical escalation occurs when: - Issue requires specialized expertise - Resolution exceeds team capabilities - Vendor support is required - Issue affects multiple customers

Escalation path: Support Engineer → Senior Engineer → Technical Lead → Network Operations Manager

7.2 Management Escalation

Management escalation occurs when: - SLA targets are at risk - Customer satisfaction is compromised - Issue requires business decision - Customer requests management involvement

Escalation path: Team Lead → Department Manager → Director of Operations

8. Customer Satisfaction

Customer satisfaction is measured through:

- Post-incident surveys for resolved tickets
- Quarterly customer satisfaction surveys
- Net Promoter Score (NPS) assessments

- Customer feedback during business reviews

Satisfaction scores are tracked and improvement plans are developed for areas scoring below targets. Customer feedback is reviewed monthly and action items are assigned to address concerns.

9. Contact Information

For customer service support:

- Customer Service Hotline: +971-XX-XXX-XXXX
- Email: bno-support@eand.ae
- Customer Portal: <https://portal.eand.ae/bno>
- Emergency Support: +971-XX-XXX-XXXX (24/7 for Platinum/Gold tiers)
- Customer Service Manager: Available during business hours

For service requests, customers can submit tickets through the customer portal, email, or phone. Critical issues should be reported via phone for immediate response.

Appendix A: Customer Service Checklist

Standard checklist for handling customer service requests:

- ☐ Create ticket with all relevant details
- ☐ Classify priority according to SLA
- ☐ Acknowledge customer within response time
- ☐ Gather all necessary information
- ☐ Perform initial diagnostics
- ☐ Document troubleshooting steps
- ☐ Implement resolution
- ☐ Verify service restoration
- ☐ Confirm with customer
- ☐ Update ticket with resolution
- ☐ Close ticket

- [] Send customer satisfaction survey

Appendix B: Customer Communication Templates

Service Outage Notification

"Dear [Customer Name],

We are currently experiencing a service issue affecting your [Service Type] connection. Our technical team is actively working to resolve this issue. We will provide updates every [Update Frequency] until service is restored.

Estimated resolution time: [Time] Ticket number: [Ticket Number]

For updates, please visit our customer portal or contact support at [Phone Number].

Thank you for your patience.

BNO Support Team"

Service Restoration Confirmation

"Dear [Customer Name],

Service has been restored to your [Service Type] connection. The issue has been resolved and your service should now be operating normally.

Root cause: [Brief Description] Resolution: [Brief Description]

If you continue to experience any issues, please contact our support team immediately.

Ticket number: [Ticket Number]

Thank you for your patience.

BNO Support Team"
